Physics

**Project Reference:
Complex Optimization Tasks**

Algorithmus Schmiede

We develop computer programs that solve complex mathematical / technical tasks.

Our employees have a doctorate in natural sciences.
We program in **Python** and **C++**.

You benefit from:

- Algorithms with maximum reliability
- A deep understanding of physical relationships
- Scientific way of working

Complex Optimization Tasks

Solution of complex optimization tasks that can no longer be solved with standard optimization libraries.

Contents:

- Modeling of a problem that is difficult to describe in a clear mathematical structure
- Clear visual presentation of the problem and the algorithm
- Selection of a suitable optimization method:
Either use of library functions or individual implementation
- Development of suitable benchmarks for evaluating the optimization result

Example: Area Optimization

Division of new development areas into individual plots of 500 m² each with a sensible aspect ratio.

⇒ Immediate estimation of the development costs.

Contents:

- Modeling as a graph
- Multi-stage optimization procedure using: Monte Carlo (Metropolis-Hastings), Simulated Annealing, mod. Dijkstra, ...
- Implementation via REST-API on AWS (Amazon Web Services): API gateway + Lambda + RDS (Relational Database Service)

Challenges:

- Finding further (previously unspecified) optimization criteria (e.g. arrangement along alignments, drive-through capability)
- Computing time < 15 sec

Example: Area Optimization

Starting Situation:

- total area
- road connections

Step 1:

- establishing basic road connectivity
- while avoiding acute angles

Example: Area Optimization

Step 2:

- Decomposition into (almost) rectangular sub-areas
- Optimized insertion of new edges and nodes into the graph

Step 3:

- Connection of all sub-areas to the road network
- Modification of the Dijkstra algorithm (many start points & several end points possible)

Example: Area Optimization

Final result:

Algorithmus Schmiede

Data Science | Numerik | Physik
